APPLICATION / AI SPECIALIST

Jhon Camilo Vásquez

Public accountant building AI agents and financial platforms with Claude.

Code-based calculation. Evidence-based narrative. Review before publication.

A / AI AGENT

Financial analysis for SMEs

Problem. Reading native PDFs, scans and spreadsheets requires extracting, reconciling and contextualizing figures before forming a diagnosis.

Contribution. I built a pipeline with Spanish and English OCR, deterministic validation, 22 sector-aware indicators and Claude-generated narrative. Code performs the calculations; the model writes with references to the figures.

Evidence. In production and used by analysts with company documents. Delivers a Word report and an Excel workbook, with data-quality gates before analysis.

Documents > Extraction > **Validation** > Calculation > Report

F / DATA AUTOMATION

Healthcare receivables

Problem. A 116,524-row report needed to become collection requests for dozens of health insurers, without an integrated email directory.

Contribution. I built insurer-level consolidation, master-file validation, email-directory matching and draft preparation with a review screen.

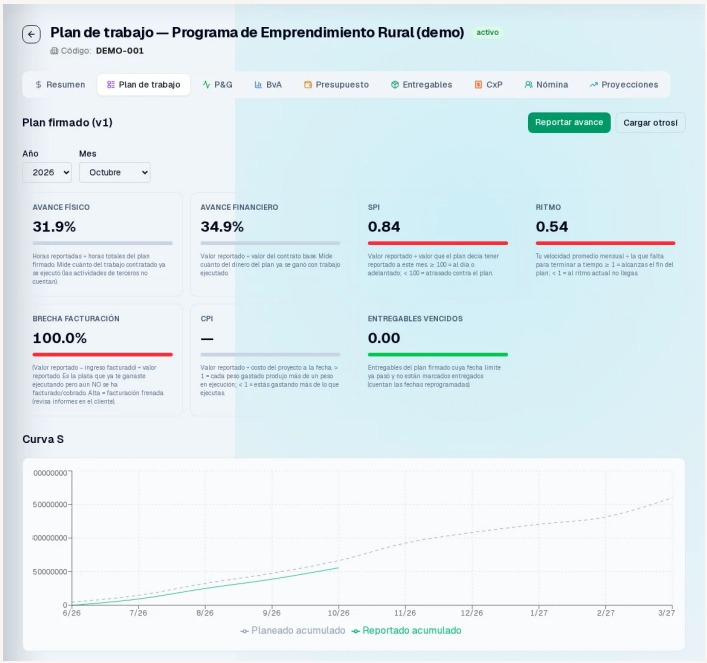

Evidence. 62 of 62 insurers matched the manual calculation to the peso for a reference month: zero differences across 14 fields. The brief reports 93 tests and detection of offsetting entries and duplicate tax IDs.

Scope: reconciliation of one reference month, not extrapolated to every period. Figures reported in the brief, without a new technical audit.

E / PROJECT FINANCIAL CONTROL

From accounting files to project oversight.

Spreadsheet synchronization with review, project income statements, budgets, projections, progress and S-curves.

INTERFACE / DEMO DATA

712 + 81

unit + integration tests in one delivery

A recent delivery classified 42 of 90 third-party activities and reconciled the exact contract total.

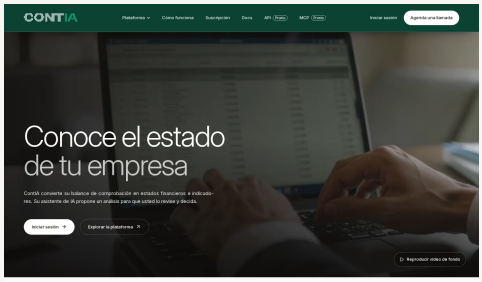

Platform in production. The described delivery was prepared as a PR for deployment, with migration and agent review.

Next.js / PostgreSQL
Apps Script / Python

D / CONTIA

Financial SaaS with company-level isolation.

A product built with a partner: trial-balance imports and 9 DuPont and operational-efficiency KPIs in production module 1. Own backend, agents and KPI engine; isolation in the application and Postgres/RLS.

Public API + MCP: approved design, not built yet. 24 decisions and 16 acceptance criteria; not presented as an available capability.

QUALITY BEFORE BUILDING

AI proposes. Evidence decides.

Agents with persistent memory, criteria set before testing, and security, performance and maintainability reviews.

01	02	03	04	05
Plan	Criteria	Tests	Errors	QA

If a review report is missing, the orchestrator blocks the change. Secret controls, backups and recovery before deployment.

B Financial statements

Checks statements and margins. Separates observed changes, hypotheses and the documents needed to verify them. Build or testing status to be confirmed.

C Tax agent

Colombian personal income tax drafts, versioned regulations and change monitoring. Word and Excel outputs. Pilot or usage status to be confirmed.

H Infrastructure and automation

n8n with MCP and chat-based agents. Deployment with automatic rollback on failed health checks. No uptime metrics are claimed.

Fit for the role

Evidence: Claude agents, Python and APIs, custom dashboards and operational automation. Technical English: B1.

Explicit gaps: Microsoft Copilot and Power BI are tools to adopt; no demonstrated experience or machine-learning achievements are claimed.
